

# Network Infrastructure Review

Many organizations suffer from not having an accurate performance picture of their network that shows all configurations, servers, routers and other devices. Without this perspective, it's difficult to identify the components responsible for poor network performance. What's more, hidden inefficiencies can cause delays that raise costs and impact customer service.

With a comprehensive network performance and infrastructure review from VLSystems, you can avoid these problems by receiving a thorough assessment and up-to-date documentation of your network. The information found in this assessment can help you optimize usage of your hardware investments, plan effectively for upgrades, maximize user efficiency and prevent potential crises. Additionally, you can benefit from cost savings by boosting the performance of your mission-critical applications.

## About VLSystems

VLSystems, founded in Irvine, Calif. in 1978, is a Cisco Advanced Security Specialized partner and a Microsoft Gold Certified partner specializing in secure information solutions involving Cisco LAN/WAN, data center and security, Microsoft advanced infrastructure, SharePoint Portal Server, workflow and collaboration, and managed services.

To arrange a private consultation, contact us at (949) 660-8855 or (800) 542-5050.

An infrastructure review occurs at the beginning of your partnership with VLSystems. Each review is completed by a certified and highly skilled engineer who, in most cases, is the same engineer to implement any future changes to your network. This is our way of laying the foundation for a long-term relationship as your technology solution provider and trusted advisor.

## Components and Benefits

Your infrastructure review will include examination and assessment of the following:

- **Network components (e.g., routers, concentrators, switches and cabling)**
- **Computer hardware (e.g., servers, desktops, RAID controllers, disk size and formatting, and protocol binding orders)**
- **Operating system**
- **Security assessment**
- **Contingency planning**
- **Backup and restore systems**
- **Risk analysis**
- **Application performance**

When your assessment is complete, you will receive a final report that fully documents your network, its servers, and their core and support applications. Your report will also include recommendations for reducing risk and enhancing existing services and capabilities — all tailored to your specific infrastructure and business goals. Overall, the information gathered during your review will yield a high return on your investment by helping you to better allocate both current resources and future purchases.
